THE NEW STANDARD FOR RADIAL HEMOSTASIS

The preferred choice for radial hemostasis
- Transparency ensures continuous observation of the access site
- Dual compression balloons provide precise compression of the radial artery without compromising local nerve structure

An innovative design that makes it extremely easy to use
- Air titration provides a more precise way of applying pressure to the radial artery
- Adjustable straps make application fast and simple
- Two band lengths provide a precise fit for optimal patient sizing

Consistent and controlled performance
- Less sensitive to small air adjustments, resulting in more consistent arterial blood flow as compared to competitive balloon inflation devices
- Allows less variability when incrementally titrating air from the device, resulting in maintenance of adequate blood flow in the radial artery
- Achieves hemostasis at low pressures, minimizing the chances of applying occlusive pressures
